
coarse 891 codes / 9.80 bits + fine 1,225 codes / 10.26 bits = 20.058 bits per bar, both panels
(λ = 3 on the micro block, right panel only)
original — one contextual encoder feeds both halves
bar t
contextual encoder (causal, bars ≤ t)
coarse
fine
bar t's state is spread across every later bar's token
sign(s_t) recoverable from bar t's own token
0.5112
chance 0.50
re-specified — the fine half is per-bar
bar t
contextual encoder
causal, bars ≤ t
pointwise encoder
bar t only
coarse
fine
each bar's fine half is a function of that bar alone
sign(s_t) recoverable from bar t's own token
0.9047
interface alone: 0.4995-0.5182, 3/3 FAIL
+ λ=3 class weight: mean 0.9047, min 0.8839
(restated rule; the run's gate is 0.90 on every dim)
