

(a) train once, evaluate forward

(b) what separates a training window from the label it must not see

(c) is the 60-bar margin earned? measured on all 200 instruments

signed return — the channel a label leak would travel on

ACF at lag 60: mean 0.0067 worst 0.0191

premise holds

absolute return — volatility clustering, not a label channel

ACF at lag 60: mean 0.2323 worst 0.3604

premise does NOT hold

control arm recovers a known answer first (AR(1) $\rho=0.97$, $n=200000$), so a null reading is a measurement and not a silent failure.
