

coarse 891 codes / 9.80 bits + fine 1,225 codes / 10.26 bits = 20.058 bits per bar, both panels ($\lambda = 3$ on the micro block, right panel only)

original — one contextual encoder feeds both halves

$\text{sign}(s_t)$ recoverable from bar t 's own token

0.5135
chance 0.50

re-specified — the fine half is per-bar

$\text{sign}(s_t)$ recoverable from bar t 's own token

0.9047
gate 0.90
